Experiments were completed to study possibilities to
obtain higher yields from poplar pulps made by the
sulphate process. Cooks were carried out by a variation
of cooking parameters and with warm liquor pre-
impregnation. It was shown, that 30% to 40% of wood
substance is solubilized even after a very mild treat-
ment. A Ross-diagram of different cooks shows similar

The defibering and beating properties of different semipulps can be represented in linear form with the aid of scale transformation. Such representation makes it possible to investigate the behaviour of different raw materials under different cooking conditions with regard to defibrability. Furthermore, it is shown that with extensive delignification a product can be obtained which does not as yet disintegrate into (Engineering--Chemical, TT, v. 8, no. 9) (over)
